

## Hier eine kurze Beschreibung des Datenstroms, wie er in einem OOTemplate verwendet werden kann.

Es gibt 2 Arrays mit Daten, die in einem OOTemplate Verwendung finden können :

- \$users
- \$projects (seid openTimetool V2.2.5)

Zusätzlich stehen noch einige globale Angaben zur Verfügung:

- \$timespanFrom
- \$timespanUntil
- \$sum

Damit und mit dieser Kurzbeschreibung sollten eigentlich alle denkbaren Auswertungen durchführbar sein.

### Auszug aus dem mitinstallierten Standard-Template (benutzerbezogene Auswertung):

```
{foreach($users as $aUser):}
```

**Benutzer:** {\$aUser['name']} {\$aUser['surname']}

```
{foreach( $aUser['days'] as $aDay ):}
```

**{\$aDay['date']}**

```
{foreach($aDay['times'] {$aTime['comment']}  
as $aTime):}  
{$aTime['task']}
```

```
{$aTime['du  
ration']}  
{if($aTime['  
duration']):}  
h{endif}
```

```
{endforeach;endforeach}
```

```
{endforeach}
```

**Sample (Auszug) des \$users-Arrays, wie es durch dieses oben gezeigte Beispiel ausgewertet wird:**

```
<p>Users:Array
(
    [1] => Array
        (
            [name] => Root
            [surname] => Master
            [days] => Array
                (
                    [11022009] => Array
                        (
                            [times] => Array
                                (
                                    [0] => Array
                                        (
                                            [_user_id] => 1
                                            [_user_login] => root
                                            [_user_name] => Root
                                            [_user_surname] => Master
                                            [_user_email] => root@localhost
                                            [_user_isAdmin] => 1
                                            [_user_password] =>
b4b8daf4b8ea9d39568719e1e320076f
```

```

                                            [_user_hoursPerDay] =>
[_projectTree_id] => 4
[_projectTree_name] => My project
[_projectTree_l] => 8

```

Anton Kejr, system worx PartG	11.02.09	2
-------------------------------	----------	---

```

        [timestamp] => 1234350420
        [durationSec] => 7200
        [comment] =>
        [duration] => 02,00
        [task] => Start
    )

[1] => Array
(
    [_user_id] => 1
    [_user_login] => root
    [_user_name] => Root
    [_user_surname] => Master
    [_user_email] => root@localhost

```

.  
 .  
 .  
 .  
 .  
 .

Hier ein Auszug aus dem mitgelieferten Template für projektbezogene Auswertung.

{foreach(\$projects as \$aProject):}		
Projekt : {\$aProject['projectname']}		Summe: {\$aProject['sum']} h
<b>Tätigkeit</b>	<b>Beschreibung</b>	<b>Zeit</b>
{foreach(\$aProject['users'] as \$aUser):}		
<b>Benutzer: {\$aUser['name']} {\$aUser['surname']}</b>		<b>Summe: {\$aUser['sum']} h</b>
{foreach( \$aUser['days'] as \$aDay ):		
<b>{ \$aDay['date']}</b>		
{foreach(\$aDay['times'] as \$aTime):}{ \$aTime['task']}		{ \$aTime['duration']}
		{if(\$aTime['duration']):}
		h{endif}
{endforeach}		
<b>Summe Tag ({ \$aDay['date']}):</b>		<b>{ \$aDay['sum']} h</b>
{endforeach}		
<b>Summe Benutzer ({ \$aUser['name']} {\$aUser['surname']}):</b>		<b>{ \$aUser['sum']} h</b>
{endforeach}		
<b>Summe Projekt ({ \$aProject['projectname']}):</b>		<b>{ \$aProject['sum']} h</b>
{endforeach}		
<b>Summe gesamt</b>	<b>{ \$sum} h</b>	

**Sample (Auszug) des \$projects-Arrays, wie es durch dieses oben gezeigte Beispiel ausgewertet wird:**

**Projects:Array**

```
